10 [^2]: Q: How to split a list into "sublists" based on condition? Suppose I have a list of "groups" with values in them. List<> Groups = new List<>(); Groups.Add(new List() { "Foo", "Bar", "FooBar", "Baz", "Baz" }); Groups.Add(new List() { "Foo", "Bar", "FooBar", "Baz", "Baz", "Quux" }); I want to split the groups into "sub-lists" based on the number of values of a specific "group". In this case, the first sub-list will consist of the groups with two values, the second will have three values, etc. The groups "Foo", "Bar", "FooBar", "Baz", "Baz", "Quux" will become: List<> Foo = new List<>(); List<> Bar = new List<>(); List<> FooBar = new List<>(); List<> Baz = new List<>(); List<> BazBar = new List<>(); List<> Quux = new List<>(); I'd like to do this without having to load all the data into memory. A: I think it's very simple using LINQ like this: List splitGroup(List group) { var result = new List<>(); int count = group.Count; for(int i = 0; i < count; i++) { currentGroup = new List<>(); while(i
